

CC - Email Notification System using Apex in Salesforce

Problem Statement

Develop a console-based Apex program in Salesforce that sends an email notification to a specified email address using Salesforce email services. The program should define the recipient email, subject, and message body, and send the email using the built-in Messaging class. (With / Without Attachment)

1. Login to Salesforce

Open:

<https://login.salesforce.com>

Login with your Salesforce Developer Account.

2. Open Developer Console

1. Click Gear Icon (⚙)
2. Click:

Developer Console

Developer Console opens in new window.

3. Create Apex Class

Go to:

File → New → Apex Class

Class Name:

SendEmail

Click:

OK

4. Paste Apex Code (Without Attachment)

Delete default code and paste:

```
public class SendEmail {  
  
    public static void sendEmail() {  
  
        Messaging.SingleEmailMessage mail = new Messaging.SingleEmailMessage();  
  
        mail.setToAddresses(new String[] { 'yourmail@gmail.com' });  
  
        mail.setSubject('Salesforce Notification');  
  
        mail.setPlainTextBody('Hello, this email is sent from Salesforce  
Apex. ');  
  
        Messaging.sendEmail(new Messaging.SingleEmailMessage[] { mail });  
    }  
}
```

Replace:

yourmail@gmail.com

with your actual email address.

5. Save Apex Class

Press:

Ctrl + S

6. Open Execute Anonymous Window

Go to:

Debug → Open Execute Anonymous Window

Shortcut:

Ctrl + E

7. Execute Program

Paste:

```
SendEmail.sendEmail();
```

Click Execute.

8. Check Email

Open Gmail inbox.

Sometimes the email may go to:

- Spam Folder
- Promotions Tab

This is normal in Salesforce Developer Edition.

9. Apex Code (With Attachment)

If assignment requires attachment also, replace previous code with this code.

```
public class SendEmail {  
  
    public static void sendEmailWithAttachment() {  
  
        Messaging.SingleEmailMessage mail = new Messaging.SingleEmailMessage();  
  
        mail.setToAddresses(new String[] {'yourmail@gmail.com'});  
  
        mail.setSubject('Salesforce Email With Attachment');  
  
        mail.setPlainTextBody('Hello, this email contains attachment.');  
        Messaging.EmailFileAttachment attachment = new  
Messaging.EmailFileAttachment();  
  
        attachment.setFileName('sample.txt');  
  
        attachment.setBody(Blob.valueOf('This is sample attachment file. '));  
  
        mail.setFileAttachments(new Messaging.EmailFileAttachment[]  
{ attachment });  
  
        Messaging.sendEmail(new Messaging.SingleEmailMessage[] { mail });  
    }  
}
```

10. Execute Attachment Program

Paste:

```
SendEmail.sendEmailWithAttachment();
```

Click Execute.

11. Check Output

Open:

Logs → Debug Only

12. Important Concepts

Apex

A programming language used in Salesforce for backend development.

Messaging Class

The Messaging class is used in Salesforce to send emails through Apex.

SingleEmailMessage

Messaging.SingleEmailMessage is used to create and send a single email.

13. Conclusion

The Email Notification System was successfully implemented using Apex in Salesforce. The program sends email notifications with and without attachments using the built-in Messaging class through console-based execution.
